Recombinant SARS-CoV 2 Spike RBD_ T385I mFc-Chimera

Cat. No. Ab-P0040

Size 100 µg

Host Species Human

Expression Host 293F

Protein construction A DNA sequence encoding SARS-CoV-2 (2019-nCoV) spike protein (RBD) substituted T385I fused with the Fc region of mouse IgG2a in C-terminus.

Purity >95% as determined by SDS-PAGE

Formulation 0.22µm filtered solution in PBS pH 7.4

Storage Store it under sterile condition at -70°C upon receiving. Recommend to aliquot the protein in to smaller quantities for storage. Avoid repeated freeze – thaw cycles.

Molecular Mass The recombinant SARS-CoV-2 (2019-nCoV) Spike Protein (RBD, mFc fusion) consists of 443 amino acids and predicts a molecular mass of 49.8 kDa.

Background The Spike protein (S) of and SL-CoVs, which is a type I transmembrane glycoprotein and mediates the entrance to human respiratory epithelial cells by interacting with cell surface receptor such as angiotensin-converting enzyme 2 (ACE2)
The Spike protein is a large type I transmembrane protein containing two subunits, S1 and S2. S1 mainly contains a receptor binding domain (RBD), which is responsible for recognizing the cell surface receptor. S2 contains basic elements needed for the membrane fusion.

In previous studies, a number of potent monoclonal antibodies against SARS coronavirus (SARS-CoV) have been identified. These antibodies target more specifically the 193 amino acid length (N318-V510) receptor binding domain (RBD) within the S protein is the critical target for neutralizing antibodies. Some of the antibodies recognize different epitopes on RBD, for example the SARS-CoV neutralizing antibodies CR3014 and CR3022 bound noncompetitively to the SARS-CoV RBD and neutralized the virus in a synergistic fashion.
